

EE492 / EE592 Real-Time Digital Signal Processing  
 Quiz #1  
 Open Books, Notes, Calculators (no programs, no graphing)

1. Write the hexadecimal values for the following 24-bit fixed-point decimal fractions. The first one is done for you.

+0.5000000	\$400 000
+0.0312500	\$
-0.6250000	\$

2. Write the 24-bit fixed-point, decimal fractions (at least 7 digits of precision) for the following hexadecimal values. The first one is done for you.

+0.2500000	\$200 000
	\$248 000
	\$F24 000

3. Write the hexadecimal values for the following 56-bit fixed-point accumulator (decimal integer/fraction). The first one is done for you.

+128.0000000	\$40 000 000 000 000
+ 32.0312500	\$
- 4.6250000	\$

4. Write the 56-bit fixed-point accumulator [decimal integer/fraction (at least 7 digits of precision)] for the following hexadecimal values. The first one is done for you.

+64.0000000	\$20 000 000 000 000
	\$01 300 000 000 000
	\$F8 600 000 000 000
	\$32 600 000 000 000

5. For each of the following hexadecimal values in register y1, determine the resulting 14-digit hexadecimal value in accumulator, a when the following instruction is executed:

move y1, a

y1	a
\$123 456	\$
\$876 543	\$
\$CBA 987	\$

6. For each of the following hexadecimal values in accumulator b, determine the resulting 6-digit hexadecimal value in register x0, when the following instruction is executed:

`move b, x0`

b	x0
\$00 123456 789ABC	\$
\$00 234567 89ABCD	\$
\$00 000001 500000	\$
\$FF 000000 800000	\$

7. Assume two vectors, **a** and **b** and are stored in memory as follows:

Write a short code to do the following:

- Initialize address registers to point to  $a_0$  and  $b_0$  (assume linear addressing not modulo)
- Compute the inner product (use REP instruction) as

$$c = \sum_{n=0}^9 a_n b_n$$

- The result should be rounded at the end of the calculation.

8. Write a short code to compute the following equation

$$(0.4)^2 + 0.5$$

Three lines of correct code will yield full credit; four or more lines of correct code will yield half credit.

For the following questions, determine the register, accumulator, and memory states after execution of the instruction. Put 6 hexadecimal digits in each box (or 2 in the case of a2). If you leave the box blank, we assume the state does not change. If the instruction cannot be executed, write "CANNOT BE EXECUTED"

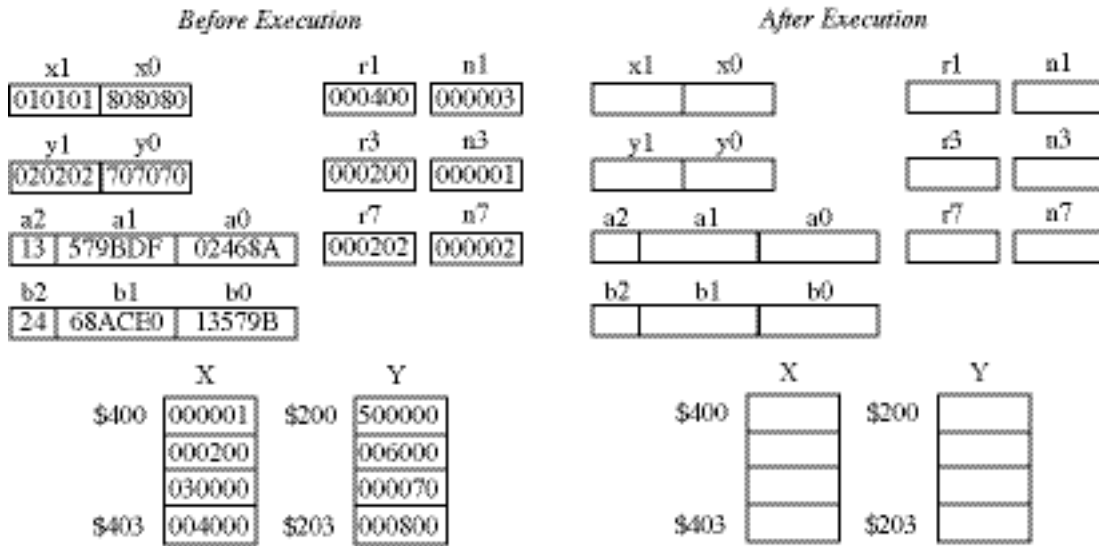

9. `move x:(r1+n1),y1`

Before Execution						After Execution													
x1		x0		r1		n1		x1		x0		r1		n1					
010101		808080		000400		000003													
y1		y0		r3		n3		y1		y0		r3		n3					
020202		707070		000200		000001													
a2		a1		a0		r7		n7		a2		a1		a0		r7		n7	
13		579BDF		02468A		000202		000002											
b2		b1		b0						b2		b1		b0					
24		68ACE0		13579B															
		X				Y				X				Y					
\$400		000001		\$200		500000		\$400				\$200							
		000200				006000													
		030000				000070													
\$403		004000		\$203		000800		\$403				\$203							

10. `move x0,y:(r3+n3)`

Before Execution						After Execution													
x1		x0		r1		n1		x1		x0		r1		n1					
010101		808080		000400		000003													
y1		y0		r3		n3		y1		y0		r3		n3					
020202		707070		000200		000001													
a2		a1		a0		r7		n7		a2		a1		a0		r7		n7	
13		579BDF		02468A		000202		000002											
b2		b1		b0						b2		b1		b0					
24		68ACE0		13579B															
		X				Y				X				Y					
\$400		000001		\$200		500000		\$400				\$200							
		000200				006000													
		030000				000070													
\$403		004000		\$203		000800		\$403				\$203							

11. `move a,y:(r3)+`

12. `move b1,y:-(r7)`

*This page EE592 only*

13. For the following moduli (plural of modulus) and starting addresses, determine the first valid address, *after* the starting address, where an array may be modulo-addressed. The first one is done for you.

Modulus (Decimal)	Starting Address	First Valid Address for Modulo Addressing
8	\$F	\$10
40	\$1A	
255	\$10F	
256	\$10A	
257	\$10F	

---

For the following questions, determine the address that the assembler assigns for array storage. Note the use of DSM (Define Storage Modulo) and DS (Define Storage). The first one is done as an example (values are decimal).

14.

```
        org x:$a
hisvec  dsm      4
```

ANSWER: The array hisvec is stored at address x:\$00000C

15.

```
        org x:$123
hervec  dsm      42
```

16.

```
        org x:$246
myvec   ds       64
```

17.

```
        org x:$100
yourvec dsm      128
```

18.

```
        org x:$3
vec1    dsm      24
vec2    ds       16
vec3    dsm      10
```
